ABOUT

Dairy has valuable input for a resilient, sustainable food system including nutrition assets that are critical for ensuring long-term health of a growing global population. Given its nutrient-rich package, dairy has the ability to provide the world's population not just basic nutrition, but better nutrition. For developed and developing countries, dairy has the potential to reinvigorate rural economies, providing sustainable livelihoods for smallholder farmers

and a resilient source of economic growth. Dairy can make a significant contribution towards meeting the challenges of nutritional security, sustainability and reduction in diseases related to poor quality diet. The side-event will showcase concrete examples of projects in the dairy sector that have addressed multiple challenges through social, organizational and technological innovations at the nexus between the SDGs, climate change and ICN2 objectives.
