Founder, CEO, Energy of Africa

Cameroon

Energy of Africa

Energy of Africa transforms waste from agricultural farms (field residues, maize husks, etc.) into biogas, that is used for heating/drying and as a biofertiliser to boost soil yields and as part of the circular economy. The business enables families with little access to energy and gas to produce their own energy (biogas) from waste from agricultural activities and some of this biogas is used to dry certain fruits (cocoa, mango, etc.). The business particularly targets small and medium-sized farms grouped into cooperatives.
