

For all projects in regenerative agriculture, certified by ORMEX we required Project Developers (including Governments) to monitor the co-benefits of each Project related to environment, biodiversity and water. We have linked concrete criteria to 10 SDGs.

There are all visible in our methodology, **pages 83 to 114**. This sounds a lot but these are all automated in our digital platform for the Project Holders.

Here is also a paragraph on our website:

"Ecosystemic Benefits linked to the United Nations SDGs: ORMEX Carbon Credits include quantified indicators for 10 out of 17 Sustainable Development Goals (SDGs).

The Ecosystemic benefits of regenerative agricultural activities are reported according to SDG-specific targets, and quantified through evaluation criteria and their precise indicators.

According to ORMEX's "Ecosystemic Regenerative Agriculture Methodology", some of the ecosystemic benefits are mandatory and must be monitored by Project Holders on a regular basis. Others are optional and may be applied only for projects at a national scale."
